

Fork Positioner for Forklifts

Forklift Fork Positioner - A fork positioner is actually a device made out of top quality materials intended to endure the most challenging operations and work environments. This particular piece of equipment enables the person driving to operate the forks hydraulically without leaving the seat. Side shifting models have the added ability to be able to laterally position the arms or the entire load so as to facilitate much more exact lifting and position in a quicker and more efficient method.

The blade pocket is quite unique and enables the operator to securely sway the forks into position without any fear of destroying the positioning cylinders. This could allow the driver the option to be able to execute simultaneous or independent fork movement, depending on the requirements of the job. For most forklifts with non-OEM carriages, complete carriages are necessary. Standard OEM carriages can be converted into blade positioners on existing units.
